

RHINOS

Read this information about rhinoceroses, then complete the table below, explaining what the words mean. If you're unsure, read the relevant sentence again.

You can identify members of the rhinoceros family by their large dimensions, their diet of plants, and thick, protective hide. Although the skin may resemble armour-plating, it is very sensitive to sunburn and insect bites. This is the reason they wallow around in mud, which acts as extra protection.

The name *rhinoceros* comes from two Greek words: *rhino* (nose) and *ceros* (horn). Rhino horns are not bone and continue to grow throughout their lifetime. Horns are composed of a protein called keratin, which is the same substance that hair and fingernails are made from.

Rhinos have well-developed senses of hearing and smell, but poor eyesight. If you were to stand motionless, even as close as thirty metres away, you might not be detected (unless you smelled awful). If you were to make a sound, however, you would immediately be in danger. In that situation, finding a tree to climb is a better strategy than trying to outrun them. They can run at between 30 and 40 mph!
